

Mini Practical

Responsible AI Guidelines for Linkific

Company	Linkific
Task	Write Responsible AI Guidelines for the Company
Date	5 October 2026
Focus	Fairness, Privacy, Security, Transparency, Accountability & Human Oversight

1. Introduction

Artificial Intelligence is increasingly being used by companies to automate tasks, analyze information, assist employees, and support decision-making. Linkific uses AI technologies in areas such as HR automation, employee assistance, document processing, AI-powered tools, and workflow automation. These guidelines define how AI should be developed and used safely, fairly, securely, and responsibly.

2. Purpose

- Ensure AI systems are fair and non-discriminatory.
- Protect personal, employee, and confidential company information.
- Maintain transparency and appropriate explainability.
- Improve the accuracy and reliability of AI outputs.
- Maintain clear human and organizational accountability.
- Ensure appropriate human control over high-impact AI actions.

3. Responsible AI Principles

3.1 Fairness and Non-Discrimination

- Use representative and high-quality training data.
- Test AI systems for potential bias and evaluate outcomes across relevant user groups.
- Avoid unnecessary use of sensitive or demographic information.
- Do not allow AI systems to make high-impact decisions without appropriate human review.

3.2 Privacy and Data Protection

- Collect only the information required for the intended purpose.
- Do not expose personal or confidential information unnecessarily.
- Do not send confidential company information to unauthorized external AI services.
- Store sensitive information securely and apply appropriate access controls.
- Follow company data-retention and deletion policies.

3.3 Security

- Use authentication and authorization for AI tools.
- Apply role-based access control.
- Protect API keys, credentials, and secrets.
- Validate user inputs and protect against prompt injection and malicious instructions.
- Restrict AI actions according to user permissions and maintain audit logs for important actions.

3.4 Accuracy and Reliability

- Validate important AI-generated information.
- Use trusted sources when factual accuracy is required.
- Test AI systems using representative scenarios.
- Detect and handle hallucinations.
- Provide fallback mechanisms when the AI cannot confidently answer a request.

3.5 Human Oversight

- Maintain human review for high-impact decisions.
- Allow users to question or override AI recommendations where appropriate.
- Clearly define when human approval is required.
- Do not allow AI to perform sensitive actions without proper authorization.

3.6 Transparency and Explainability

- Clearly identify AI-generated content where appropriate.
- Explain the purpose of AI systems to users.
- Document important AI workflows, limitations, and decision processes.
- Provide understandable explanations for important AI-assisted decisions where feasible.

3.7 Accountability

- Assign clear ownership for every production AI system.
- Maintain documentation for AI models and workflows.
- Record important AI actions through audit logging.
- Investigate AI-related incidents and define procedures for reporting and resolution.

4. Responsible Use of Generative AI

Employees SHOULD:

- Use AI for legitimate and authorized business tasks.
- Verify important AI-generated information.
- Review generated code before using it in production.
- Remove unnecessary confidential information from prompts.
- Report incorrect or harmful AI outputs.

Employees SHOULD NOT:

- Upload passwords, API keys, credentials, or secrets.
- Upload confidential employee information without authorization.
- Use AI to make unauthorized decisions about employees.
- Treat AI-generated information as automatically correct.
- Use AI to bypass company security controls.
- Copy AI-generated code into production without review and testing.

5. Responsible AI Development Lifecycle

Stage	Responsible AI Requirement
Planning	Identify purpose, risks, users, and potential impact.
Data Collection	Ensure data is relevant, appropriate, secure, and sufficiently representative.
Development	Follow secure coding and responsible model-development practices.
Testing	Test accuracy, fairness, security, reliability, and failure cases.
Deployment	Implement access controls, human oversight, monitoring, and logging.
Monitoring	Monitor performance, bias, security incidents, and unexpected behavior.
Maintenance	Update models and controls when requirements or risks change.
Retirement	Safely remove models, data, credentials, and associated resources when no longer required.

6. AI Risk Classification

Risk Level	Example	Required Controls
Low	Internal text summarization	Basic review and access control
Medium	Employee productivity assistant	Testing, monitoring, authorization, human review
High	Recruitment or employee evaluation	Fairness testing, human approval, audit logging, security review
Critical	Fully automated high-impact employee decisions	Should not operate without appropriate human control and governance

7. AI Incident Management

Any AI-related incident should be reported and investigated. Examples include biased output, hallucinated information, privacy leakage, unauthorized AI actions, prompt injection, security vulnerabilities, unauthorized access, incorrect employee recommendations, or unexpected model behavior.

Incident Process: Detect → Report → Investigate → Contain → Correct → Monitor → Document

8. Monitoring and Auditing

AI systems should not be considered safe simply because they passed their initial testing. Regular reviews should evaluate accuracy, bias, security, privacy, access permissions, model performance, AI-generated errors, user feedback, audit logs, and unexpected behavior. High-risk AI systems should receive more frequent and detailed reviews.

9. Developer Responsibilities

- Follow secure AI and software development practices.
- Validate AI outputs where necessary.
- Protect confidential information.
- Implement authentication and authorization.
- Test for bias and unexpected behavior.
- Maintain appropriate logging and monitoring.
- Document AI limitations.
- Report AI-related security or ethical issues.
- Ensure human approval for sensitive actions.
- Continuously improve AI safety and reliability.

10. Employee Responsibilities

- Use AI only for authorized purposes.
- Protect company and employee information.
- Review important AI outputs.
- Follow company security policies.
- Report AI errors or harmful outputs.
- Do not bypass access controls.
- Understand that AI-generated information may be incorrect.

11. Responsible AI Deployment Checklist

- Purpose of the AI system is clearly defined.
- Training/input data is appropriate.
- Potential bias has been evaluated.
- Privacy requirements are satisfied.
- Authentication and authorization are implemented.
- Sensitive actions require appropriate human confirmation.

- System has been tested for hallucinations and incorrect outputs.
- AI actions are logged.
- Monitoring is implemented.
- AI incident-response process is defined.
- Users are informed about AI usage where appropriate.
- A responsible owner is assigned to the system.

12. Conclusion

Responsible AI should be treated as an essential part of AI development rather than as an additional feature. For Linkific, responsible AI means developing systems that are fair, secure, private, transparent, reliable, and accountable.

AI should assist employees and improve productivity while maintaining appropriate human control over important decisions. By applying these guidelines throughout the AI lifecycle, Linkific can reduce risks associated with bias, privacy violations, hallucinations, security threats, and unauthorized AI actions while maintaining trust and business value.

13. Technologies / Concepts Covered

Artificial Intelligence, Generative AI, Responsible AI, AI Ethics, Machine Learning, Fairness, Privacy, Security, Human Oversight, Explainability, Accountability, AI Governance, Risk Management, and Audit Logging.
